

BAT-TRACKER

Batman Minifig Collection Tracker

User Guide

Version	Details
Version	1.3 — reflects all features to date
File	batman-minifig-tracker.html
Total minifigs	207 across 9 themes
Requirements	Any modern browser — no install, no server needed

1. Getting Started

Bat-Tracker is a single HTML file. Download it and open it in Chrome, Edge, Firefox, or Safari — no installation required.

Tip: Your collection is saved automatically in your browser. No internet connection is needed to use the tracker — except for the URL auto-fill feature.

1.1 Restoring a Previous Collection

If you open the tracker in a browser with no existing collection data, a restoration notice appears automatically after a short delay.

Option A — Import a Backup File

1. In the restoration notice, click Import Backup JSON.
2. Select your batman-tracker-backup.json file.
3. Collected figures, custom figures, edits, and section overrides are all restored.

Option B — Copy from Browser Storage

4. Open your old tracker file in the same browser.
5. Press F12 to open DevTools, go to Application > Local Storage.
6. Copy the value of the batrk3 key.
7. Open the new tracker, paste the value under the same key in DevTools, press Enter, then refresh.

Note: Click Don't show again to permanently dismiss the restoration notice if you are starting fresh.

2. The Interface

2.1 Header

- Shows the Batman logo, tracker title, and global progress bar.
- The progress bar spans both Official and Custom tabs combined.
- Count and percentage update instantly on every toggle.

2.2 Controls Bar

Control	What it does
---------	--------------

Search	Live filter across name, ID, theme, and maker. Results update as you type.
Status filter	All minifigs / Collected only / Not collected only.
Theme filter	Filter by a specific LEGO theme. Rebuilds when you switch tabs.
Sort	Year ascending, Year descending, Name A–Z, or Theme.
Official / Custom tabs	Switch between sections. Active tab highlights yellow (Official) or purple (Custom).
Result count	Number of figures matching current filters.

2.3 Footer Bar

Button	Action
Reset Collection	Clears all collected flags. Does NOT remove any figures or edits. Asks for confirmation first.
Export JSON	Downloads a full backup including collected status, custom figures, edits, and section overrides.
Import JSON	Restores all data from a previously exported backup file.

3. Minifig Cards

Each figure is shown as a card in a responsive grid containing the image, ID, name, theme, year, and set numbers.

3.1 Marking as Collected

Click anywhere on the card image OR the circular toggle button in the card footer. When collected the card border and name turn green, a Got it badge appears, and the toggle fills green with a checkmark. Click again to unmark.

3.2 Card Elements

Element	Description
Image	BrickLink CDN image. A bat-silhouette placeholder shows if the image fails to load.
ID	BrickLink/Brickset minifig ID in yellow monospace text (e.g. sh0016, bat001).
Name	Full descriptive name. Turns green when collected.
Theme / Maker	Official figures show their LEGO theme. Custom figures show the maker/artist name.
Year	Release year.
Set pills	Up to 5 set numbers. Custom figures show a notes snippet instead.
BrickLink / Source	Opens the BrickLink page (official) or source URL (custom) in a new tab.
Edit button	Appears on image hover. Opens the edit modal for that figure.
Custom badge	Purple badge in the top-left, visible only on custom figures.

4. Sections

Both tabs divide figures into four sub-sections. Sections with no matching figures hide automatically.

Section	Colour	Who appears here
Batman	Yellow	Name contains 'batman' or 'batwing'.
Bruce Wayne	Purple	Name contains 'bruce wayne'.
Other / Allies	Blue	Robin, Batgirl, Alfred, Nightwing, Gordon, and all other non-villain characters.
Villains	Red	Joker, Bane, Catwoman, Harley Quinn, and 90+ others detected by keyword matching.

Override: Use the Section override dropdown in any figure's Edit modal to manually assign it to a specific section. Set to Auto-detect to restore automatic classification.

5. Official Figures

5.1 The Dataset — 207 Figures Across 9 Themes

Theme	Count	Years
Super Heroes (Batman II)	94	2011–2025
Collectible Minifigures	43	2017–2020
Batman I	28	2006–2008
The LEGO Batman Movie	16	2017–2018
Batman Classic TV Series	13	2016–2024
Batman The Animated Series	6	2023
The LEGO Movie 2	3	2019
Dimensions	3	2015–2016
The LEGO Movie	1	2014
Total	207	

5.2 Editing an Official Figure

Hover over a card and click the Edit button on the image.

Field	Notes
-------	-------

ID	Changing the ID migrates collected status to the new ID automatically.
Name	Free text.
Theme	Changing this moves the figure in the theme filter.
Year	Number.
Set numbers	Comma-separated, e.g. 76001-1, 76012-1.
Image URL	Direct image URL. Live preview thumbnail shown below the field. Blank uses BrickLink CDN.
BrickLink URL	Blank uses the auto-generated BrickLink page URL.
Section override	Force the figure into Batman, Bruce Wayne, Other, or Villain. Auto-detect restores automatic classification.

Click Save Changes to apply. Click Delete to permanently remove the figure. Edits are stored as differences from the original data — backups stay small.

5.3 Adding an Official Figure

Click + Add Figure in the Official section header. All fields are optional — ID is auto-generated from the name if left blank. Duplicate IDs receive a suffix automatically.

6. Custom Figures

The Custom tab holds third-party, fan-made, or custom-painted figures not in official LEGO sets. Custom figures use the same four-section layout as official ones.

6.1 Adding a Custom Figure

Click + Add Figure in the Custom section header. All fields are optional:

Field	Notes
ID	Auto-generated from the name if blank (e.g. custom-batman-keaton-a3f2).
Name	Defaults to Unnamed Figure if blank.
Maker / Artist	Brand or creator — shown on the card in place of theme.
Theme	Defaults to Custom.
Year	Year acquired or made.
Notes	Up to 60 characters shown on the card. Full text visible in edit modal.
Image URL	Direct image link. Live preview thumbnail below the field.
Link / Source	Shop page or any URL — shown as the Source button on the card.
Section override	Optional manual section assignment.

6.2 Auto-Fill from URL

At the top of the Add / Edit Custom modal is a purple Auto-fill from URL panel. Paste any product page URL and click Fetch. The tracker fetches the page through a public CORS proxy and parses its metadata automatically — no AI or API key required.

The following data sources are checked in order:

- Open Graph tags (og:title, og:image, og:description, og:site_name) — used by most shop and social pages.
- Twitter Card meta tags (twitter:title, twitter:image, twitter:description).
- Schema.org JSON-LD structured data — extracts product name, brand, SKU, image, and manufacturer.
- Standard HTML fallbacks — page h1 heading, title tag, and meta description.

Fields populated automatically: Name, Maker/Artist, Theme (defaults to Custom), Year, Notes (up to 200 characters from description), Image URL, and Source link. Only non-empty fields are filled — existing values are not overwritten if nothing is found.

Works everywhere: Auto-fill no longer requires claude.ai or any API key. It works when the file is opened from your desktop, a local server, or any browser — as long as you have an internet connection.

If fetch fails: Some sites block the CORS proxy or have no machine-readable metadata (e.g. image galleries, login-protected pages). In that case the status bar shows a warning and you can fill fields manually.

6.3 Importing Custom Figures

Click Import CSV / JSON in the Custom section header. Drag-and-drop a file or click to browse. Two formats are accepted:

- JSON: an array of objects. Any fields can be omitted. Fields: id, name, maker, theme, year, notes, image, link.
- CSV: a header row (id, name, maker, theme, year, notes, image, link) followed by data rows.

Import is an upsert: matching IDs are updated, new IDs are added, and unmentioned figures are left unchanged.

6.4 Editing and Deleting Custom Figures

Hover over a custom card and click Edit. All fields are pre-filled. Click Delete to permanently remove, or Save Figure to apply changes.

7. Collection Management

7.1 Exporting Your Collection

Click Export JSON in the footer bar to download batman-tracker-backup.json. This file contains:

- All figures you have marked as collected.
- All custom figures.
- Edits made to official figures (stored as diffs — not full copies).
- Any user-added official figures.
- All section overrides.

Recommendation: Export a backup before switching to a new version of the tracker, clearing browser data, or moving to a different browser.

7.2 Importing a Backup

Click Import JSON in the footer bar, select your backup file. All existing data is replaced with the backup contents.

7.3 Resetting Your Collection

Click Reset Collection (red button, footer bar) to clear all collected/not-collected flags. A confirmation dialog shows exactly how many figures will be reset.

Important: Reset Collection only clears collected flags. It does NOT delete figures, remove edits, or remove custom entries. Your full figure list is preserved.

7.4 Browser Storage

All data is saved automatically to your browser's localStorage (key: battrk3). This means:

- Data persists across refreshes and browser restarts on the same browser and device.
- Data does NOT transfer automatically to a different browser or device — use Export / Import.
- Clearing browser site data or history will erase your collection. Always keep an exported backup.

8. Searching and Filtering

8.1 Search

Filters by name, ID, theme, and maker simultaneously. Case-insensitive. Live — updates on every keystroke. Example: searching robin finds all Robin variants; sh00 finds all IDs starting with those characters.

8.2 Status Filter

- All minifigs — shows everything (default).
- Collected — shows only figures you own.
- Not collected — shows only figures you still need.

8.3 Theme Filter

Lists all themes in the active tab. Rebuilds when switching tabs. Select a theme to show only figures from that theme.

8.4 Sorting

- Year ascending (default) — oldest first.
- Year descending — newest first.
- Name A–Z — alphabetical by figure name.
- Theme — grouped by theme alphabetically, then by year within each theme.

8.5 Pagination (Official Tab)

Each section (Batman, Bruce Wayne, Other, Villains) shows 48 figures per page with its own independent Prev / Next controls. The Custom tab is not paginated.

9. Tips and Tricks

Finding a Specific Variant

Search with a partial ID — for example sh0016 returns sh0016, sh0016a, and sh0016b together.

Want List

The Not collected filter effectively becomes your want list. Combine it with a theme filter to browse what you still need from a specific line.

Custom Figure Images

Use a direct image URL (ending in .jpg or .png) rather than a product page URL. BrickLink product images, Flickr direct links, and shop CDN URLs all work well.

Section Override Use Cases

Some figures auto-classify unexpectedly due to name matching — for example, Disco Batman lands in Villains because the villain keyword list includes that phrase. Use the Section override in the Edit modal to permanently correct any misclassified figure.

Keeping Data Safe

Export a backup after every session where you have made significant changes. Name backups with a date (e.g. batman-collection-2025-04-26.json) to maintain a history.

End of User Guide
